

From the product idea to market success with CoolCase

Whether components, assemblies or complete products, CoolCase realises individual solutions geared to the customer’s particular needs and specifications – from development of the initial idea, via tool and fixture design, through to production, assembly and delivery logistics. Our engineers and technicians use acknowledged CAD systems, such as Pro Engineer and Solid Works, to develop customer-specific solutions in response to daily enquiries. An in-house prototyping

workshop guarantees fast translation of the latest developments into line production, and close contact is maintained with the individual customer throughout the whole process. Professional metal-working know-how and a comprehensive range of services guarantee the success of high-volume series production in certified quality. On this basis, CoolCase develops, manufactures and assembles the most varied solutions as contract production. Continuous investment in modern

machinery and regular further training for the employees serve our promise of cost-optimised development and design at the highest level, with professional project managers offering one-stop coordination.

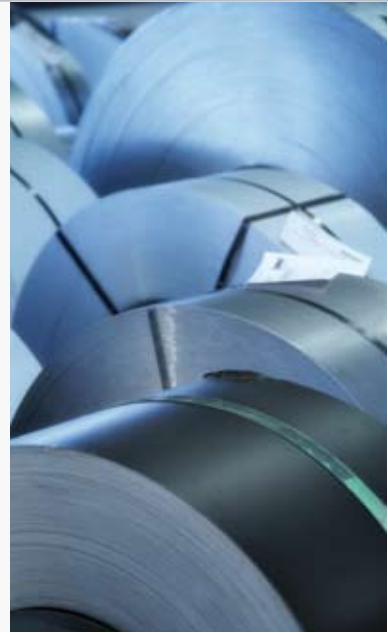

OEM cases

Well-planned technology – Colour from the very beginning

Why paint the finished product when you can order ready-coated coils and sheet metal? The subsequent processing must naturally be backed by corresponding technologies for stamping, bending and press-fitting.

CoolCase has built up expertise through many years of experience in the manufacturing of PC and server cases for the commercial and industrial sectors, in quantities far exceeding the million mark.

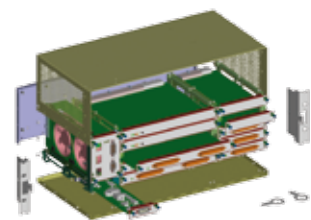

Design the way the machine expects

Why concern yourself with things which others can do much better? As a manufacturer of mechanical subracks for the whole range of electronics, from PCBs to OLEDs, we employ engineers who know our machines inside-out and can coax maximum performance from the minimum input.

Your core business deserves your full attention! Leave all the side issues to us – within the framework of a co-design or design-in project.

Through experience to perfection

Quality and price are determined to a large extent at the design stage. Especially in the case of high-volume tool-based manufacturing over a long service life, it is important for the designers to receive feedback from the start-up phase.

CoolCase here offers ideal prerequisites with technologies for prototyping, various CNC stamping, laser and bending machines to realise pilot batches, and presses to create the progressive dies for line production, not to mention an in-house tool design department.

Designed, optimised, manufactured, assembled and tested

Top-quality systems for challenging applications. The demands placed on medical technology are enormous. Once you enter a certain class of products, the solutions must immediately stand out by way of a sophisticated, eye-catching appearance and tested functional perfection. Mechanical designs tailored to the latest electronics used in display systems – and right in line with current market expectations.

The long-standing experience over several generations of displays at CoolCase is founded on countless own developments and contributions to the mechanical design of complete systems.

Professional and meticulous

Customer service

You can rely on the quality of customer service from CoolCase in every respect. Whether you have questions about a particular product, or whether you are looking for project advice – we can guarantee you our competent, fast and uncomplicated assistance.

With active project support, we help to coordinate your path to success.

Tested quality

Our company is certified to DIN EN ISO 9001:2008 and has established professional quality management at all stages of manufacturing. Technical measuring and test procedures ensure that every customer receives a perfect service.

The auditing of quality testing and manufacturing processes by our renowned international customers, and with it the individualisation of test methods and cycles, is inherent to daily business at CoolCase. Test reports and quality certificates are usually transmitted electronically. Cooperation with independent test institutes, furthermore, ensures an objective assessment of the work processes.
